Farm delivery requirement

Farm delivery requirement for the Jensen Unit is estimated to be 3.15 acre-feet per irrigable acre as derived in Table 24. Losses of irrigation water on the farm may be placed in three classes: (1) farm ditch losses, (2) surface waste, and (3) deep percolation. Table 22 on the foregoing page gives the estimated farm irrigation water losses and efficiencies for the Jensen Unit. Farm ditch losses are dependent upon slope and the intake rate and water-holding capacities of the soils. Surface waste is dependent upon slope and allowable soil moisture levels. Deep percolation is dependent upon intake rate and water-holding capacities of the soils, depth of the crop root zones, and minimum moisture levels allowed. These limitations were used as a guide for estimating the efficiencies shown.

Diversion requirement

Diversion requirement is influenced by the efficiency of its conveyance system as well as the farm requirement. Conveyance losses occur in transit from the source of water supply to the farm headgate. They comprise evaporation from the canal water surface, transpiration by vegetation along the canal banks, seepage, and operational waste.

Seepage losses depend upon the wetted area, head, and permeability of the soils traversed by the canal system as well as the length of the canal. The administrative loss was estimated at 3 percent, whereas the conveyance loss was estimated at 12 percent, making a total weighted average conveyance loss of 15 percent. Table 23 summarized the estimated conveyance loss for the major canals in the Jensen Unit.

Table 23
Estimated canal seepage losses in the Jensen area

Canal	Length (miles)	Capacity (second- feet)	Loss Per mile (percent)	Percent Total (percent)	Percent of lands served	Weighted average (percent)

1/ Return flow will compensate for stream losses.

CHAPTER IV

WATER UTILIZATION

Project Plan

Under the Jensen Unit plan, Tyzack Dam and Reservoir will be constructed on Brush Creek to a total capacity of 26,000 acre-feet with 24,000 acre-feet active to regulate Brush Creek flows for municipal and industrial and irrigation use. Tyzack Pumping Plant and Aqueduct, with a capacity of 50 second-feet, will be built to convey the municipal and industrial water from Tyzack Reservoir to Ashley Creek for municipal and industrial use in Ashley Valley. Most of the water pumped to Ashley Creek will be delivered for irrigation use in exchange for high quality water diverted into the municipal and industrial system at Ashley Spring. Brush Creek water not pumped at Tyzack, together with spills and downstream inflows, will be utilized to meet downstream Brush Creek irrigation rights and irrigation demands in the Jensen area. The bulk of irrigation demands in the Jensen area (new water and replacement for water diverted upstream) will be pumped from the Green River at Burns Pumping Plant (capacity 97.4 second-feet). Water will also be pumped at Burns Pumping Plant to supplement project return flows and existing supplies delivered to the Stewart Lake Waterfowl Management Area.

Operation of the Tyzack facilities will be coordinated with operation of the existing Steinaker Reservoir of the Vernal Unit. Winter Ashley Creek flow divertible to Steinaker will be utilized to avoid winter operation of Tyzack Pump and Aqueduct. Existing spills at Fort Thornburg diversion will be used to reduce pumping at Tyzack. Coordinated operation with Steinaker will have no detrimental effect on Vernal Unit supplies.

During the initial period of operation, prior to full realization of the municipal and industrial demand, water will be delivered from Tyzack to meet downstream irrigation requirements and keep pumping at Burns Pumping Plant to a minimum. As municipal and industrial demands increase, Burns Pumping Plant will pump greater amounts of water.

Land Acreage

A detailed land classification has been completed for the Jensen Unit. In making the operation studies, the lands were divided between the upper and lower Brush Creek areas as summarized in the table on the following page. This division was made at the points where the discharge lines from the Burns Pumping Plant intercept the four major canals serving the lower area. The lower Brush Creek area will be served by

the Burns Pumping Plant from the Green River, and the upper Brush Creek area will be served from Little Brush Creek, Big Brush Creek, or Tyzack Reservoir.

	Acreage				Total	
	Project lands		6W lands			
	Presently irrigated	New lands				
Upper Brush Creek area ^{1/}	664	141			805	
Lower Brush Creek area	2,974	303	333		3,610	
Total	3,638	444	333		4,415	

^{1/} Lands inundated by Tyzack Reservoir have been deleted.

Project Operation Studies

The operation studies involved in the Jensen Unit of the Central Utah Project are shown in Tables 25 and 26. A description of these studies and the column explanation follows.

Operating criteria

The Jensen Unit will be operated to supply water for the following purposes: (1) municipal and industrial water to Vernal and Jensen and (2) irrigation water in the vicinity of Jensen.

Water supply

The water supply for the Jensen Unit operation study was based on (1) the present modified flow of Big Brush Creek near Vernal, which reflects the operation of Oaks Park Reservoir and the existing diversion via Oaks Park Canal to the Ashley Creek drainage, (2) the historical flow of Little Brush Creek near mouth, which reflects the operation of East Park Reservoir and the pipeline transporting water over the sink area, and (3) the historical flow of Green River near Jensen. Water will be pumped from the Green River to supplement irrigation supplies and to replace upstream water used for municipal and industrial purposes. Natural flows of Green River are expected to fully meet the requirements of the Burns Pumping Plant since the historical flows of the river near Jensen are far in excess of the project diversion requirements. Projected future uses under rights senior to the project rights are not expected to encroach on the project water supply.

Priority of water use

Direct streamflow of Little Brush Creek will be used to meet irrigation demands of the upper Brush Creek area (not servable by pump from the Green River) and then the lower Brush Creek area (servable by pump from the Green River).

Reservoir operation

Tyzack Reservoir will be operated to provide municipal and industrial water for Vernal and Jensen. Spills from the reservoir will be combined with the remaining flow of Little Brush Creek after meeting the upper area demands to provide irrigation water in the lower Brush Creek area when possible rather than pumping from the Green River.

Preproject Study (Table 25) Column Explanation

- Column 1 Present modified flow of Big Brush Creek near Vernal, Utah. The flows for April 1939 through 1972 are from U.S. Geological Survey records; 1920 through March 1939 are estimated by correlation with the past modified flow of Ashley Creek near Vernal. Present modified flows at this station assume Oaks Park Reservoir has been in operation for the period of study.
- Column 2 Present modified flow of Little Brush Creek near mouth. The 1964-69 flows are from U.S. Bureau of Reclamation records, and 1920-63 and 1970-72 records are by correlation with the present modified flow of Big Brush Creek near Vernal, Utah. These flows are affected by releases from East Park Reservoir and the pipeline over the sink area.
- Column 3 Demand for 664 acres in the upper Brush Creek area at 3.70 acre-feet per acre.
- Column 4 Upper Brush Creek demand met from the flow of Little Brush Creek.
- Column 5 Upper Brush Creek demand met from the flow of Big Brush Creek near Vernal.
- Column 6 The remaining demand to the upper Brush Creek area (Col. 3 minus Cols. 4 and 5).
- Column 7 Remaining flow of Little Brush Creek (Col. 2 minus Col. 4).
- Column 8 Remaining flow of Big Brush Creek near Vernal (Col. 1 minus Col. 5).
- Column 9 Demand for 3,307 acres in the lower Brush Creek area at 3.70 acre-feet per acre.
- Column 10 Lower Brush Creek demand met from Little Brush Creek flow.
- Column 11 Lower Brush Creek demand met from the flow of Big Brush Creek near Vernal.

CHAPTER IV

WATER UTILIZATION

- Column 12 The remaining demand of the lower Brush Creek area (Col. 9 minus Cols. 10 and 11). This is the preproject shortage to presently irrigated lands.
- Column 13 Remaining flow of Little Brush Creek after meeting lower area demand (Col. 7 minus Col. 10).
- Column 14 Remaining flow of Big Brush Creek near Vernal after meeting lower area demand (Col. 8 minus Col. 11).

Tyzack Reservoir Operation (Table 26) Column Explanation

- Column 1 Present modified flow of Big Brush Creek near Vernal, Utah. The flows for April 1939 through 1972 are from U.S. Geological Survey records; 1920 through March 1939 are estimated by correlation with the past modified flow of Ashley Creek near Vernal. Present modified flows at this station assume Oaks Park Reservoir had been in operation for the period of study.
- Column 2 Present modified flow of Little Brush Creek near mouth. The 1964-69 flows are from U.S. Bureau of Reclamation records and 1920-63 and 1970-72 records are by correlation with the present modified flow of Big Brush Creek near Vernal, Utah. These flows are affected by releases from East Park Reservoir and the pipeline over the sink area.
- Column 3 Demand for 133 acres in an area above Little Brush Creek at 3.70 acre-feet per acre.
- Column 4 Area above Little Brush Creek. Demand met from Big Brush Creek near Vernal.
- Column 5 Demand for 672 acres in the area below Little Brush Creek at 3.70 acre-feet per acre.
- Column 6 Area below Little Brush Creek. Demand met from Little Brush Creek.
- Column 7 Area below Little Brush Creek. Demand met from Big Brush Creek near Vernal.
- Column 8 Storable flow of Big Brush Creek (Col. 1 minus Cols. 4 and 7).
- Column 9 Spills from Steinaker Reservoir. These spills were taken from Vernal Unit water supply operation study.
- Column 10 Municipal and industrial demand of 18,000 acre-feet per year.
- Column 11 End-of-month content of Steinaker Reservoir without Jensen Unit.
- Column 12 Water pumped to Steinaker Reservoir from Tyzack Reservoir for credit to meet winter demands.
- Column 13 Demand met by spills from Steinaker Reservoir.
- Column 14 Demand met by Steinaker Reservoir credits.
- Column 15 Demands met by direct pumping from Tyzack Reservoir.

CHAPTER IV

WATER UTILIZATION

- Column 16 Shortage (Col. 10 minus Cols. 13, 14, and 15).
- Column 17 Accumulated credit or deficit in Steinaker Reservoir limited by 33,200 acre-feet of active capacity.
- Column 18 End-of-month content of Steinaker Reservoir with coordinated Jensen Unit operation.
- Column 19 Evaporation on Tyzack Reservoir based on end-of-month content for the previous month and an evaporation rate of 3.31 feet per year.
- Column 20 Tyzack Reservoir end-of-month content limited by 24,000 acre-feet active capacity.
- Column 21 Spills from Tyzack Reservoir.
- Column 22 Remaining flow of Little Brush Creek below the upper Brush Creek area (Col. 2 minus Col. 6).
- Column 23 Total supply available (Col. 21 plus Col. 22).
- Column 24 Demands on lower Brush Creek area for class 6W lands (333 acres).
- Column 25 Demand met from Little Brush Creek and Tyzack Reservoir spills.
- Column 26 Demand met by pumping from the Green River for class 6W land. This replaces water used upstream for project purposes and brings those lands up to their preproject supply.
- Column 27 Shortage to class 6W lands. This is the same shortage that occurred under preproject conditions.
- Column 28 Demand for 3,277 acres of project lands in lower Brush Creek area.
- Column 29 Demand met from Little Brush Creek and Tyzack Reservoir spills.
- Column 30 Demand met by pumping from the Green River (Col. 28 minus Col. 29).
- Column 31 Water supplied to Stewart Lake Waterfowl Management Area by pumping from the Green River during the off-peak season.
- Column 32 Remaining flow of Brush Creek below the lower Brush Creek area (Col. 23 minus Cols. 25 and 29).

Annual summary
Jensen Unit operation study

Table 26

Project Water Supply

The water developed by the Jensen Unit is divided into two parts: irrigation and municipal and industrial. The following tabulation summarizes the project water.

	<u>Acre-feet</u>
Irrigation	
Remaining demand (supplemental lands) to be supplied by the project (Col. 12, preproject study)	3,300
Less remaining demand of 6W lands	-300
Supply to new lands, 444 acres at 3.7 Subtotal	<u>1,600</u> <u>4,600</u>
Municipal and industrial	18,000
Total	22,600

Colorado River Depletions

Colorado River streamflow depletions attributable to the Jensen Unit were estimated on an annual basis for the 1930-72 period and are shown in Table 27. The 1930-72 annual depletion averaged 15,000 acre-feet but varied from year to year depending on the amount of project water delivered and the amount of water stored or withdrawn from storage. Estimates included the depletion on the project portion of water supplied to irrigation for municipal and industrial purposes, reservoir evaporation losses, and the effect of carryover storage.

The productive farm consumption is estimated at 1.78 acre-feet per irrigable acre. The nonproductive consumptive use is estimated as 20 percent on conveyance losses of 0.55 acre-foot per acre and 20 percent on the farm losses of 1.37 acre-feet per acre, giving a total use of 2.16 acre-feet per acre, or about 60 percent of the 3.70 acre-feet per acre diversion requirement.

Table 27
Estimated Colorado River depletion
(Unit--1,000 acre-feet)

Year	Irrigation		Depletion			
	Project water	Productive (60% x 1)	on municip- and non- productive consump- tive use (80% x 1)	pal and in- dustrial wa- ter (80% x 10,000)	Evapor- ation from Reservoir	Change in content

CHAPTER V

HYDROLOGIC DATA

Tyzack Dam and Reservoir

Storage reservations in Tyzack Reservoir will be made for fish and wildlife purposes, municipal and industrial purposes, irrigation, and flood control. The capacities selected are summarized in Table 28. The area and capacity tables are shown in Table 29.

Sediment storage

The results of sediment studies for Tyzack Reservoir are discussed in the report "Sedimentation Study for Tyzack Damsite, Central Utah Project, Utah" dated March 23, 1972. It was concluded in this report that the sediment deposition in the Tyzack Reservoir for a 100-year period would be 580 acre-feet. No sediment distribution studies are necessary because less than 5 percent of the total reservoir capacity will be occupied by the sediment. The depth of sediment at the dam after 100-years will be less than 10 feet, which is considered the minimum required distance from the outlet works to the streambed. No allocation for sediment will be required for the reservoir.

Evaporation losses

The evaporation rate is estimated to be the same at Tyzack Reservoir site as used in the Special Report No. 8, Utah State Agricultural College, "Consumptive Water Use and Requirements in the Colorado River Area of Utah." The yearly total evaporation of 3.31 feet was distributed over the year in the same monthly pattern as for the evaporation for Utah Lake near Lehi, Utah. Distribution by months is given in the following tabulation.

Month	Evaporation rate (acre-feet) per acre)
October	0.22
November	.08
December	.03
January	.03
February	.03
March	.15
April	.30
May	.44
June	.54
July	.58
August	.53
September	.38
Total	3.31

Table 28
Tyzack Reservoir
Elevations, areas, and capacities

	Elevation (m.s.l.)	Total capacity (acre-feet)	Incremental capacity (acre-feet)	Area (acres)
Top of joint-use capacity (normal water surface)	5,608.2	26,000		521
Joint-use capacity			18,000	
Top of active conservation capacity	5,560.7			
Active conservation capacity			6,000	
Top of inactive capacity (minimum water surface)	5,528.5			114
Inactive and dead storage			2,000	
Streambed	5,483.0			

Table 29
Tyzack Reservoir area-capacity

Elevation	Area (acres)	Capacity (acre-feet)
5,481.5	0	0
5,490.0	2.8	6.2
5,500.0	25.8	125.5
5,510.0	53.6	518.0
5,520.0	86.4	1,216.0
5,530.0	120.0	2,236.0
5,540.0	169.4	3,670.0

5,590.0	408.5	17,841.0
5,600.0	468.6	22,224.0
5,610.0	534.1	27,224.0
5,620.0	616.2	32,963.0
5,630.0	696.9	39,518.0
5,640.0	790.5	46,945.0
5,650.0	899.0	55,375.0

Reservoir capacity

At elevation 5,608.2 m.s.l. the reservoir has an active conservation and joint-use capacity of 24,000 acre-feet and a surface area of 521 acres.

At elevation 5,528.5 m.s.l. the reservoir has an inactive and dead capacity of 2,000 acre-feet and a surface area of 114 acres. This capacity includes 1,900 acre-feet recommended by the Fish and Wildlife Service for fish and wildlife purposes.

The economical active capacity of 24,000 acre-feet for Tyzack Reservoir was determined by using the maximum economical municipal and industrial diversion to Ashley Valley. The maximum is 18,000 acre-feet annually by an incremental analysis as presented in the Plan Formulation Appendix.

Outlet works capacity

Tyzack Reservoir will be used to supply irrigation water to the upper Brush Creek area and municipal and industrial water to the Vernal area.

In order to meet these demands the capacity for the outlet works of Tyzack Dam is based on the peaked reservoir releases as computed from the water supply operation study. The capacity is computed by adding columns 4, 7, 12, and 15. The outlet capacities required at various water surface elevations are indicated in Table 30.

The Corps of Engineers has recommended a safe channel capacity of 200 second-feet for Brush Creek in the report, "Preliminary Analysis of Benefits from Flood Control, Jensen Unit, Central Utah Project, Brush Creek, Utah," dated December 22, 1967. This flood control requirement was also considered in the design of the outlet works and spillway.

Spillway capacity

The inflow design flood study for Tyzack Reservoir is discussed in the report, "Inflow Design Flood Study, Tyzack Damsite, Jensen Unit, Central Utah Project, Utah," dated December 20, 1972. This study was approved for use in feasibility design by the Chief, Division of Planning Coordination, in a letter dated March 7, 1973.

The inflow design flood, composed of runoff from a major snowmelt in combination with a design spring rainstorm, has a peak of 15,000 second-feet and a 15-day volume of 21,930 acre-feet. The alternate inflow design flood is the maximum summer rain flood which has a peak of 18,500 second-feet with a 2-day volume of 12,300 acre-feet. A 100-year thunderstorm flood having a 24-hour volume of 1,470 acre-feet should be assumed to precede the inflow design summer rain flood by 24 hours.

Table 30
Tyzack Dam outlet works capacity

Year	Month	Active content					
		Total release (acre-feet)	Average release (second-feet)	Begining of month (acre-feet)	End-of-month (acre-feet)	Average (acre-feet)	Water surface elevation (feet) ^{4/}
1940	August	1/2,880	46	18,400	16,100	17,250	5,591.5
1961	September	2/2,200	37	1,500		750	5,528.5
1962	March	3/2,100	34	1,800	700	1,250	5,534.1
1962	April	3/2,100	35	700	3,900	2,300	5,551.9
1961	August	3/2,700	44	3,500	1,500	2,500	5,539.5

1/ Maximum monthly release through outlet works.

2/ Maximum monthly release through outlet works with minimum reservoir content.

3/ High monthly release through outlet works with low reservoir content.

4/ Based on end-of-month content.

5/ Average release peaked by 20 percent.

It may be possible for the inflow-design flood to occur at a time when the reservoir is full, thus the routing recommendations are that the reservoir be full to the top of the conservation storage at the beginning of the inflow design flood or joint-use capacity if joint-use flood control space is provided.

For estimating diversion during construction, the following frequency floods were computed.

Recurrence interval	Peak discharge (c.f.s.)	15-day volume (acre-feet)
5-year	400	8,200
10-year	480	9,500
25-year	560	10,900

Tailwater study

The completed tailwater study for Tyzack Dam is in the report entitled "Tyzack Dam Tailwater Study," dated May 18, 1972. Water surface profile elevations were computed at seven cross sections for flows of 100, 300, 500, 1,500, 3,000, 5,000, 10,000, 12,000, and 15,000 second-feet. This study was submitted to the Regional Office by letter dated May 19, 1972. Revisions to the study as recommended by the Chief, Division of Planning Coordination, were completed and forwarded to the Regional Office on November 7, 1972, and February 9, 1973. The revisions were approved by the E & R Center on March 16, 1973.

Measuring devices

A reservoir gage to determine the active content in Tyzack Reservoir will be installed in the gate control house at the dam. A permanent type measuring station with a rating section and continuous recorder will be provided to measure releases from the outlet works. Its capacity will range from 10 second-feet to the capacity of the outlet works. Rating of the spillway and provisions of a staff gage will be adequate to measure spills.

The existing U.S. Geological Survey gaging station in the reservoir area will not be needed following construction of Tyzack Reservoir.

Remote indicators

In accordance with the Chief Engineer's letter dated August 1, 1967, consideration has been given to the use of automatic and remote controls and indicators for water storage and conveyance systems within the Jensen Unit. Assuming the operator will visit the Tyzack Dam periodically, remote indicators will be installed in the gate control house to provide the following information: (1) reservoir water surface elevation and (2) streamflow below the dam.

A telephone or other form of voice communication will be installed at the gate control house at Tyzack Dam so the operator can readily contact other personnel as necessary or desirable.

Tyzack Pumping Plant and Aqueduct

Tyzack Pumping Plant will be used to pump water from the outlet works of Tyzack Reservoir to Steinaker Reservoir for municipal and industrial purposes in Ashley Valley. The annual amount of water pumped will not be greater than 18,000 acre-feet because part of the demands will be met by Steinaker Reservoir spills when they are available. The estimated distribution of this water is as follows.

<u>Month</u>	<u>Percent of demand</u>	<u>Pumping demand (acre-feet)</u>
March	11.7	2,100
April	7.8	1,400
May	10.5	1,900
June	11.6	2,100
July	11.7	2,100
August	11.7	2,100
September	11.7	2,100
October	11.7	2,100
November	11.6	2,100
Total	100.0	18,000

The maximum mean monthly amount of water pumped will be 2,100 acre-feet in March, June, July, August, September, October, and November which amounts to an average flow of 34.5 second-feet.

The rated capacity of the pumping plant and aqueduct was estimated by peaking the maximum mean monthly average of 35 second-feet by 30 percent and rounding to 50 second-feet. Assuming the pumping plant will be located below Tyzack Dam, the outlet works to the pumping plant will be designed for 50 second-feet when the reservoir is at minimum water surface elevation.

Cross drainage study

The completed cross drainage study for Tyzack Aqueduct is found in a separate report entitled, "Tyzack Aqueduct Cross Drainage, Feasibility Design, Jensen Unit, Central Utah Project," dated August 1967. It has been sent to the Chief, Division of Project Investigations.

Following the completion of the above study, the Tyzack Pumping Plant was moved to a site below the proposed Tyzack Dam, and that portion of the Tyzack Aqueduct serving as the discharge line was relocated

accordingly. Therefore, a supplement to the above report was prepared and approved by the Project Development Engineer in the Regional Office by a letter dated December 12, 1967.

Measuring devices

A flow meter or other measuring device will be installed at the head of the aqueduct leading from the Tyzack Pumping Plant to measure the amount of water being pumped.

Remote indicators

Remote indicators will be installed in the gate control house at Tyzack Dam to show the amount of water being pumped to the Tyzack Aqueduct.

Burns Pumping Plant

Burns Pumping Plant will lift water from the Green River to the Burton and Murray Ditches and Burns Bench and Sunshine Canals. The recommended discharge line capacities were based on "Standard Criteria for Determination of Irrigation Distribution System Capacities" approved by the Chief Development Engineer December 18, 1961, and revised in accordance with the Acting Chief Engineer's letter dated July 10, 1967. The discharge line capacities are summarized as shown below.

<u>Canal</u>	<u>Acreage</u>	Required rate ca- pacity in- cluding 15 percent conveyance
Burns Bench	1,529	39.0
Sunshine	1,304	33.0
Burton	406	13.4
Murray	371	12.0
Total		97.4

These capacities have not been rounded up to standard design capacity nor do they include any provision for wear from sediment. It was recommended that one pump with 50 percent capacity and two pumps with 25 percent capacity serve each discharge line.

The annual amount of water pumped will be 9,700 acre-feet. The monthly distribution of this water is as follows.

Month	Murray	Burton	Sun- shine	Burns Bench	Total
April	0.1	0.1	0.1	0.2	0.5
May	.1	.1	.5	.6	1.4
June	.2	.2	.5	.7	1.5
July	.4	.4	.9	1.6	3.3
August	.3	.3	.8	1.2	2.6
September	.1	.1	.1	.1	.4
October	0	0	0	0	0
Total	1.2	1.2	2.9	4.4	9.7

In addition to the project irrigation water pumped, 230 acre-feet annually of Utah Division of Wildlife Resources' water will be pumped to the Stewart Lake Waterfowl Management Area. No additional capacity will be needed in the pumps because the water will be pumped during off-peak periods. The monthly distribution of this water is as follows.

	Acre-feet
April	90
May	30
June	0
July	60
August	50
Total	230

Sediment load of Green River

In choosing pump capacities, consideration will be given to sediment carried by the Green River. Table 31 shows the U.S. Geological Survey records of sediment samples taken of Green River near Jensen for water years 1963 through 1972. The closure of Flaming Gorge Dam was made in November 1962, so these are the available records for the years that Flaming Gorge Reservoir has been in operation.

Tailwater study

The completed tailwater study for Burns Pumping Plant is in the report entitled, "Burns Bench Tailwater Study, Feasibility Design Data, Jensen Unit, Central Utah Project," dated July 1967. Water surface profile elevations were computed at seven cross sections for flows of 500, 1,000, 5,000, 10,000, 15,000, 20,000, 25,000, and 50,000 second-feet. The 100-year flood of 50,000 second-feet used in this study was based on a reconnaissance flood study of Green River near Green River, Utah, peak flows, adjusted to the gage near Jensen. The tailwater study was approved by the Chief Engineer's Office in a letter dated September 6, 1967.

Measuring devices

A flow meter or other measuring device will be installed at the head of each discharge line leading from the pumphouse to the Burton and Murray Ditches and Sunshine and Burns Bench Canals.

Remote indicators

Assuming the operator will visit Burns Pumping Plant periodically, indicators will be installed at the pumphouse to show the amount of water pumped to each canal.

A telephone or other form of voice communication will be installed at the pumping plant house at the Burns Pumping Plant so the operator can readily contact other personnel as necessary or desirable.
